

# MOVING FORWARD

FMC Corporation has been working over the last several months to develop and submit formal remedial designs to EPA for review and approval, which is necessary to implement the Interim Record of Decision (IROD) at our former operations west of Pocatello in Power County. We have been working with EPA to find a means to begin construction work this year, as EPA Region 10 advocated in issuing the IROD in September, 2012 and the Unilateral Administrative Order in June, 2013.

The remediation of the site has been divided into two phases of work: the Soil Remedy and the Groundwater Remedy. We have agreed that the Soil Remedy can be separated into two tasks: Site-wide grading for storm water control, which is planned to begin this summer, and cap construction, which would begin next year. Also during 2014, groundwater extraction performance testing will be conducted to provide information needed for detailed design of the groundwater extraction system, construction of which should commence in 2016.

We have qualified bidders drawing from a list of local and national firms who contacted us since the IROD was issued expressing interest in this construction work. We will keep you advised as we work our way through the Request For Proposal and receive EPA approval on our proposed remedial construction plans. Our objective is to be in the field this Summer 2014.

The schedule is ambitious but doable. After so many years, FMC, like all of Southeast Idaho, is looking forward to getting the property remediated and redeveloped. Thank you for your continued support. We are confident the community is ready.
